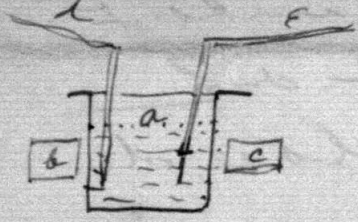
THEO. L. PAGE

Haines Landing, Me. July 15 1906

Tried many years ago & once again subsequently, to produce E by passage of light through an electrolyte & passing a magnetic field.

Now propose this:



a = glass or other insul. vessel filled with ink which has been acidulated (sulph, nitric acid) or made conductive by a salt. — b & c 2 oppos. poles of a magnet — d & E Copper wires or Electrodes dipping

into ink (in case of sulph acid — but may be carbon rods.)

If glass vessel be covered so that a ray of light enters it from above will not E be produced?

Emile Berliner

The idea of ink is to absorb the light & transform it into E when circuit of electrodes is closed.
