Talmud—Translations

Here are entered works on academies and assemblages of scholars in Palestine and Babylonia from which the texts of the Mishnah and the Jerusalem and Babylonian Talmuds developed and which were the antecedents of the yeshivas. Works on institutions devoted principally to talmudic and rabbinic learning, including the training of rabbis, founded from about the 11th century onward, are entered under Yeshivas. Works on institutions that were first founded in the early 19th century and are intended principally for the training of rabbis in a modern academic setting are entered under Rabbinical seminaries.

**Text mining**

Text mining is the process of extracting knowledge from data. It involves the use of algorithms and statistical models to discover knowledge from data. This process can be applied to various fields such as social media, healthcare, and finance. Text mining techniques include natural language processing (NLP), machine learning, and data mining. The goal of text mining is to extract useful information from unstructured data, such as text documents, emails, and social media posts.

**Text processing (Computer science)**

Text processing is a subfield of computer science that deals with the manipulation of text. It involves the use of software tools and algorithms to process and analyze text data. Text processing tasks include text extraction, text classification, and text summarization. The goal of text processing is to enable computers to understand and interact with natural language text.

**Textbook bias**

Textbook bias refers to the tendency of textbooks to reflect the biases of their authors or publishers. This can include biases related to race, gender, class, and culture. Bias in textbooks can have a significant impact on students' understanding of various topics. Textbook bias is often discussed in the context of curriculum development and instructional design.

**Textbook writing**

Textbook writing is the process of creating instructional materials that are designed to help students learn. This process involves the use of research, writing, and editing skills to create clear and accessible content. Textbook writing is a complex process that requires a deep understanding of the learning objectives and the target audience.

**Textiles**

Textiles are a broad category that includes materials such as fabrics, fibers, and yarns. Textiles are used in a wide range of applications, including clothing, home decor, and industrial uses. The study of textiles involves the exploration of historical and cultural aspects of textile production, as well as the development of new materials and technologies.

---

**Text mining**

Text mining is the process of extracting knowledge from unstructured textual data. This process involves the use of algorithms and statistical models to discover patterns and insights from textual data. Text mining can be used in various fields, such as social media analysis, healthcare, and finance.

**Text processing (Computer science)**

Text processing is a subfield of computer science that deals with the manipulation of text. This process involves the use of software tools and algorithms to process and analyze text data. Text processing tasks include text extraction, text classification, and text summarization.

**Textbook bias**

Textbook bias refers to the tendency of textbooks to reflect the biases of their authors or publishers. This can include biases related to race, gender, class, and culture. Bias in textbooks can have a significant impact on students' understanding of various topics.

**Textbook writing**

USE Transformative learning

Transformative learning (May Subd Geog)
[LC1100]
Here are entered works on a process of learning by questioning only one's own assumptions, beliefs, feelings, and perspectives in order to mature personally and intellectually or to change oneself in a meaningful way. Works on a dialectical approach to education holding that knowledge is socially produced and calling for the transformation of discriminatory conditions that result from the ideologization; modernization of knowledge by the dominant culture are entered under Critical pedagogy.

Triglycine sulphate

Triglycerides

Triglycerides are a type of fat that is an ester of glycerol and three fatty acids. They are one of the main components of dietary fats and oils and are found in a wide variety of foods, including meats, dairy products, and vegetable oils. Triglycerides are also synthesized by the liver and produced as a byproduct of the breakdown of stored fat in adipose tissue.

Triglycerides function as energy storage molecules in the body. They are stored in adipose tissue as triglyceride-rich droplets that can be mobilized and released into the bloodstream when energy is required. In the bloodstream, triglycerides are transported in lipoprotein particles, which also carry cholesterol and other lipids.

Triglycerides are broken down in the digestive tract by digestive enzymes, such as lipases, which split the triglyceride molecules into free fatty acids and glycerol. The free fatty acids and glycerol are then absorbed into the bloodstream and transported to the liver, where they are further metabolized. The metabolism of triglycerides can affect the levels of other lipids in the body, such as cholesterol and low-density lipoprotein (LDL) cholesterol.

Triglycerides are also involved in the synthesis of phospholipids, which are essential components of cell membranes. Phospholipids are synthesized by the liver from triglycerides and other lipids.

Triglycerides are essential for the normal functioning of the body, but high levels of triglycerides in the bloodstream can be associated with an increased risk of cardiovascular disease. This is because high triglyceride levels can contribute to the formation of atherosclerotic plaques, which can lead to the development of heart disease.

Triglycerides are a type of lipid that is present in all tissues and organs of the body. They are essential for the storage and transport of energy and are involved in the synthesis of other lipids, such as cholesterol and phospholipids.

Triglycerides are synthesized in the liver from dietary fats and are transported in the bloodstream as lipoprotein particles. They are also produced by the breakdown of stored fat in adipose tissue. In the bloodstream, triglycerides are transported to the muscles, where they are used for energy production.

Triglycerides are a type of lipid that is essential for the normal functioning of the body. They are involved in the storage and transport of energy, the synthesis of other lipids, and the maintenance of cell membranes.

Triglycerides are a type of lipid that is essential for the normal functioning of the body. They are involved in the storage and transport of energy, the synthesis of other lipids, and the maintenance of cell membranes.
Trio sonatas (Continued) Individual trio sonatas and collections of trio sonatas for 2 or 3 specific melody instruments and continuo are entered under the heading followed by medium of performance, e.g. Trio sonatas (Violins (2), continuo). Works about the trio sonata are entered under the heading Trio sonata.

Trios (May Subd Geog)

[M330-M386]

Here are entered collections of compositions for three instruments belonging to various families and in various combinations. Collections of compositions not in a specific form or of a specific type for three bowed stringed instruments are entered under String trios; for three wind instruments under Wind trios; for three brass instruments under Brass trios; for three woodwind instruments under Woodwind trios; and for three plucked stringed instruments under Plucked instrument trios.

Compositions for piano, violin and cello are entered under Piano trios.

Compositions for three percussionists are entered under Percussion ensembles.

Compositions for three solo voices are entered under Sacred vocal trios or Vocal trios.
